Effect of Upgraded Lignite Product Water Content on the Propensity for Spontaneous Ignition

Kai Zhang and Changfu You

pp 20-26

Publication Date (Web): December 11, 2012 (Article)

DOI: 10.1021/ef301771r

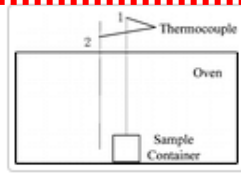

Section: Fossil Fuels, Derivatives, and Related Products

The spontaneous ignition that occurs with upgraded lignite products is a concern for its storage, handling, and transportation. The Basket testing method and Oxidation Kinetics testing method were used to identify the propensity for upgraded lignite products to spontaneously ignite. The evaluation index for the Basket testing method was spontaneous ignition temperatures and duration. The fundamental evaluation index (I) for the Oxidation Kinetics testing method was used to evaluate the propensity for spontaneous ignition. For both testing methods, all three of the lignite samples (Huolinhe lignite, Hailaer lignite, and Indonesia lignite) showed that the propensity for spontaneous ignition decreased linearly with the increase in water content of the upgraded lignite product. Commonly used Chinese bituminous coals, which are not prone to spontaneous ignition, were used as a benchmark for determining the recommended water content for upgraded lignite products. For Huolinhe lignite, Hailaer lignite, and Indonesia lignite, the recommended water contents of the upgraded products are 6.53%, 4.28%, and 7.83%, respectively. The method that was developed to determine the recommended water content could be used to guide engineering design and operations when using upgraded lignite that is highly susceptible to spontaneous ignition.

New Sludge Pretreatment Method to Improve Methane Production in Waste Activated Sludge Digestion

Dong Zhang, Yinguang Chen, Yuxiao Zhao and Xiaoyu Zhu

Environmental Science & Technology 2010 44 (12), pp 4802-4808

Abstract: During two-phase sludge anaerobic digestion, sludge is usually hydrolyzed and acidified in the first phase, then methane is produced in the second stage. To get more methane from sludge, most studies in literature focused on the increase of sludge ...Methane production from waste activated sludge is improved by alkaline hydrolysis and acidification.
